BASIC RECOMMENDATION SYSTEM

1. Introduction

This project is about creating a simple Recommendation System using machine learning techniques. A recommendation system suggests items to users based on their preferences or past behaviour. It is widely used in platforms like Netflix, Amazon, and YouTube.

The main goal of this project is to understand how machines can predict user interests and provide personalized suggestions.

2. Objective

The objectives of this project are:

1. To understand the concept of recommendation systems
2. To build a simple item recommendation model
3. To learn how user preferences are analysed
4. To apply basic machine learning techniques

---

3. Methodology

In this project, we use a dataset containing user preferences like ratings . The system processes the data and finds patterns.

There are two common approaches:

- **Content-Based Filtering**: Recommends items similar to what the user liked before
- **Collaborative Filtering**: Recommends items based on similar users

Steps followed:

1. Collect dataset (movies/products or any thing you consume)
2. Clean and preprocess data
3. Apply similarity techniques
4. Generate recommendations based on input
5. Display suggested items

---

4. Tools and Technologies Used

1. Python
2. Pandas
3. NumPy

---

5. Features

1. Suggests items based on user input
2. Uses similarity between items/users
3. Fast and simple recommendations
4. Can work with movies, products, or songs
5. Easy to understand and implement

---

6. Results

The recommendation system successfully suggested items similar to user preferences.

For example= if a user likes a movie, the system recommends similar movies based on features or ratings.

The system works efficiently for small datasets and gives accurate suggestions.

---

7. Limitations

1. Requires sufficient data for better accuracy
2. Cold start problem (new users/items)
3. Limited performance on large datasets
4. May not always capture user mood or context

---

8. Conclusion

This project helped in understanding the basic working of recommendation systems. It shows how machine learning can be used to personalize user experience. It is a foundational project for more advanced AI systems.

---

9. Future Scope

1. Improve accuracy using deep learning
2. Use large real-world datasets
3. Add hybrid recommendation system
4. Integrate with web or mobile applications
5. Include real-time user feedback
